

Best Practices in Gateway Installation

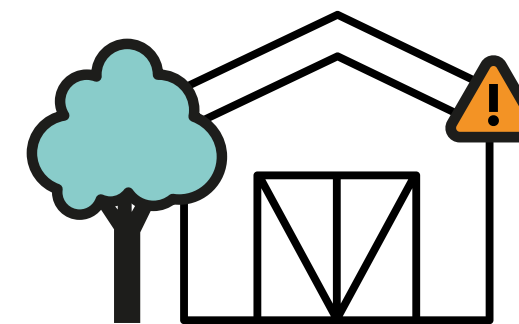

Make sure your gateway setup or gateway antenna is placed **as high** as possible for the best reception.

Gateways will often look like wifi routers. Install the gateway and/or the gateway antenna on a **stable surface**.

The gateway may be vulnerable to damage from high winds, rain or hail. They are not waterproof!

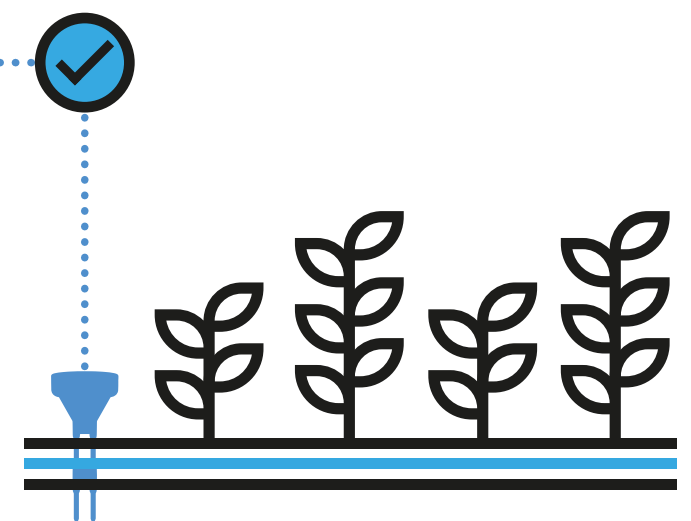

The antenna should be **unobstructed** by large buildings or natural barriers.

Line of sight

Ideally, the gateway should be **in line of sight** to the sensors.

Data connection

You will need a data connection available in order for the gateway to relay sensor data to the cloud.
